

1. First Palindromic String in an Array

Aim

To write a Python program to find the **first palindromic string** in an array of strings and analyze its time complexity.

Procedure

1. Create an array containing a set of strings.
2. Traverse the array using a for loop.
3. Take each string one by one and reverse it using `[::-1]`.
4. Compare the original string with its reversed string.
5. If both are equal, the string is a palindrome.
6. Return the first palindromic string found.
7. If no palindrome is found, return an empty string.
8. Analyze the time complexity of the algorithm.

main.py	Visualize	Run ▶	Output
<pre>1 def firstPalindrome(words): 2 for word in words: 3 if word == word[::-1]: 4 return word 5 return "" 6 words = ["abc", "car", "ada", "racecar", "cool"] 7 result = firstPalindrome(words) 8 print("First Palindromic String:", result)</pre>			First Palindromic String: ada

Result

Thus, the Python program successfully finds the **first palindromic string** in the given array.
